Assumptions for this class

The Training problem

$$\min_w L(w) + \lambda R(w)$$

$L(w)$ is differentiable, \mathcal{L} -smooth and convex

$R(w)$ is convex and “easy to optimize”

What does
this mean?

Optimality conditions

The Training problem

$$w^* = \arg \min_{w \in \mathbf{R}^d} L(w) + \lambda R(w)$$

$$0 \in \partial (L(w^*) + \lambda R(w^*)) = \nabla L(w^*) + \lambda \partial R(w^*)$$

$$\text{prox}_{\frac{\lambda}{\mathcal{L}} R}(v) := \arg \min_w \frac{1}{2} \|w - v\|_2^2 + \frac{\lambda}{\mathcal{L}} R(w)$$

What is this
prox operator?

Proximal Operator I

Let $f(w)$ be convex. We define the proximal operator as

$$\text{prox}_f(v) := \arg \min_w \frac{1}{2} \|w - v\|_2^2 + f(w)$$

Let $w_v = \text{prox}_f(v)$. Using optimality conditions

$$0 \in \partial \left(\frac{1}{2} \|w_v - v\|_2^2 + f(w) \right) = w_v - v + \partial f(w_v)$$

Rearranging

$$\text{prox}_f(v) = w_v \in v - \partial f(w_v)$$

Proximal Operator II

$$\text{prox}_f(v) := \arg \min_w \frac{1}{2} \|w - v\|_2^2 + f(w)$$

Exe:

- 1) If $f(w) = \sum_{i=1}^d f_i(w_i)$ then
$$\text{prox}_f(v) = (\text{prox}_{f_1}(v_1), \dots, \text{prox}_{f_d}(v_d))$$
- 2) If $f(w) = I_C(w) := \begin{cases} 0 & \text{if } w \in C \\ \infty & \text{if } w \notin C \end{cases}$ where C is closed and convex then $\text{prox}_f(v) = \text{proj}_C(v)$
- 3) If $f(w) = \langle b, w \rangle + c$ then $\text{prox}_f(v) = v - b$
- 4) If $f(w) = \frac{\lambda}{2} w^\top A w + \langle b, w \rangle$ where $A \succ 0$, $A = A^\top$ then
$$\text{prox}_{\lambda f}(v) = (I + \lambda A)^{-1}(v - b)$$

Proximal Operator III: Soft thresholding

$$\text{prox}_{\lambda||w||_1}(v) := \arg \min_w \frac{1}{2}||w - v||_2^2 + \lambda||w||_1$$

Exe:

1) Let $\alpha \in \mathbf{R}$. If $\alpha^* = \arg \min_{\alpha} \frac{1}{2}(\alpha - v)^2 + \lambda|\alpha|$ then

$$\alpha^* \in v - \lambda \partial|\alpha^*| \quad (I)$$

2) If $\lambda < v$ show (I) gives $\alpha^* = v - \lambda$

3) If $v < -\lambda$ show (I) gives $\alpha^* = v + \lambda$

4) Show that

$$\text{prox}_{\lambda|\alpha|}(v) = \begin{cases} v - \lambda & \text{if } \lambda < v \\ 0 & \text{if } -\lambda \leq v \leq \lambda \\ v + \lambda & \text{if } v < -\lambda. \end{cases}$$

Proximal Operator IV:

Singular value thresholding

$$S_\lambda(v) := \arg \min_w \frac{1}{2} \|w - v\|_2^2 + \lambda \|w\|_1$$

Similarly, the prox of the nuclear norm for matrices:

$$U \text{diag}(S_\lambda(\text{diag}(\sigma(A)))) V^\top := \arg \min_{W \in \mathbf{R}^{d \times d}} \frac{1}{2} \|W - A\|_F^2 + \lambda \|W\|_*$$

where $A = U \text{diag}(\sigma(A)) V^\top$ is a SVD decomposition.

Proximal method V

Minimizing the right-hand side of

$$L(w) + \lambda R(w) \leq L(y) + \langle \nabla L(y), w - y \rangle + \frac{\mathcal{L}}{2} \|w - y\|^2 + \lambda R(w)$$

$$\begin{aligned} & \arg \min_w L(y) + \langle \nabla L(y), w - y \rangle + \frac{\mathcal{L}}{2} \|w - y\|^2 + \lambda R(w) \\ &= \arg \min_w \langle \nabla L(y), w - y \rangle + \frac{\mathcal{L}}{2} \|w - y\|^2 + \lambda R(w) \\ &= \arg \min_w \frac{1}{2} \|w - (y - \frac{1}{\mathcal{L}} \nabla L(y))\|^2 + \frac{\lambda}{\mathcal{L}} R(w) \end{aligned}$$

$$= \text{prox}_{\frac{\lambda}{\mathcal{L}} R} \left(y - \frac{1}{\mathcal{L}} \nabla L(y) \right)$$

Make iterative
method based on
this upper bound
minimization

The Proximal Gradient Method

Solving the *training problem*:

$$\min_w L(w) + \lambda R(w)$$

$L(w)$ is differentiable, \mathcal{L} -smooth and convex

$R(w)$ is convex and prox friendly

Proximal Gradient Descent

Set $w^1 = 0$.

for $t = 1, 2, 3, \dots, T$

$$w^{t+1} = \text{prox}_{\lambda R/\mathcal{L}} \left(w^t - \frac{1}{\mathcal{L}} \nabla L(w^t) \right)$$

Output w^{T+1}

Proximal Operator and Optimality conditions

The Training problem

$$\min_w L(w) + \lambda R(w)$$

$$-\nabla L(w^*) \in \lambda \partial R(w^*)$$

$$w^* + \gamma \nabla L(w^*) \in w^* - (\lambda \gamma) \partial R(w^*)$$

$$w^* \in (w^* - \gamma \nabla L(w^*)) - (\lambda \gamma) \partial R(w^*)$$

$$\text{prox}_f(v) = w_v \in v - \partial f(w_v)$$

$$w^* = \text{prox}_{\lambda \gamma R}(w^* - \gamma \nabla L(w^*))$$

Optimal is a fixed point.
